MATHIS REGNAULT

Portfolio 2026

MATHIS REGNAULT
Industrial designer

11/19/2003
m.regnault.design@gmail.com
Instagram: @mathisdesigns
Paris, FRANCE.

EDUCATION

Strate School of Design, Paris | 2021 - 2026
Master's degree in Industrial Design. Final project awarded the jury's distinction.

Tokyo Communication Arts | 2024 - 2025
Semester abroad.

French Baccalauréat, Paris | 2021
Obtained with honours at Maurice Ravel high school.

SKILLS

Rhino 3D
Keyshot, V-Ray
Adobe: Illustrator, InDesign, Photoshop
Figma
Procreate

LANGUAGES

French: Native
English: Fluent
German: General knowledge
Japanese: Basic

INDUSTRIAL DESIGN EXPERIENCE

Logitech, Ireland | Internship | July - December 2026.
- Contributed to the development of MX, gaming, and creative products through concept sketching, foam prototyping, 3D modeling, rendering, and user testing.
- Iterated physical and digital prototypes to explore form and ergonomics alongside industrial designers and engineers.

Décathlon | Partnership Project | February - June 2025.
An acoustic and adaptable table designed for travelers during their quiet breaks.

Slean | Partnership Project | February - April 2025.
Repurposed office desks to create modular shelving systems.

Studio Norguet Design | Internship | February - July 2024.
Active participation in various design projects, from the creative process to the final product presentation (including chairs, sofas, lighting, tables, armchairs, and interior architecture).

ADDITIONAL EXPERIENCE

Le Paris Montparnasse | Waiter | June - July 2025.
Table service, guest reception, order processing, and beverage preparation.

DSD Organization | Event host | 2022 - 2024.
Welcomed, served, informed customers and oversaw the smooth running of events (Balenciaga fashion show, NBA game, Louboutin fashion week...).

Nursery in Frankfurt (GER) | Tutor | May - June 2020.
Staff support for organizational tasks and academic tutoring for children.

SELECTED WORKS

01. ASYMETRICA

Product :	Record player
Category :	Personal project
Date :	2025

02. TRAKK

Product :	Pulleys, outlets, tarps
Category :	Group project
Date :	2025

03. SYNC

Product :	Musical gaming console
Category :	Graduation project
Date :	2026

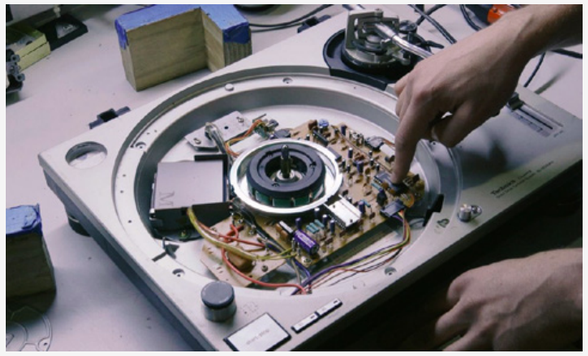
04. STAND-UP

Product :	Modular stand system
Category :	Two-person project
Date :	2025

asymetrica

THE SEMI-AUTOMATIC **TURNTABLE.**

As physical media gradually disappears, the turntable stands as a manifesto of our relationship with music. Inheriting technology from the early 20th century, it continues to shape a listening ritual built on deliberate gestures and focus. I chose to revisit this technology through a compact, asymmetrical form, designed as a durable and repairable object where the user's interaction becomes central once again.



CHALLENGES.

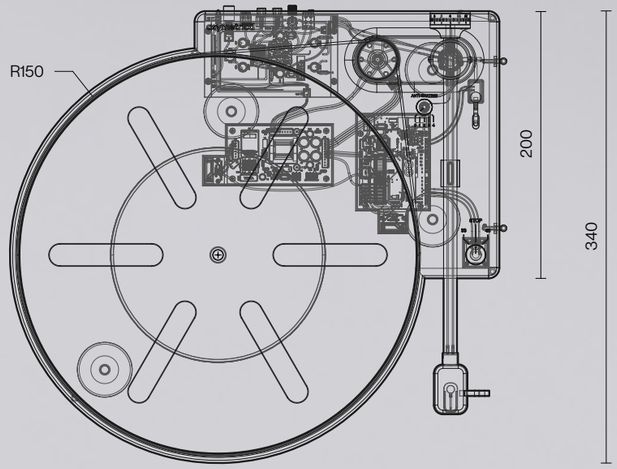
The revival of the turntable reveals several paradoxes. An object meant to celebrate the physical gesture has become automatic. A technology originally designed for cables now adopts Bluetooth. Internally, obscure and barely repairable mechanisms have turned the object into a disposable product. I wanted to challenge these contradictions to reconcile the simplicity of the gesture with a clear understanding of the mechanism.

INSPIRATIONS.

I deliberately reduced the interface to the essentials, with clear and confident controls inspired by the spirit of the 1960s. Audio equipment from the 1980s, particularly from Sony, informed the structure of my project: raw materials, a bold presence, and an object that fully embraces its mechanical nature.

CONCEPT.

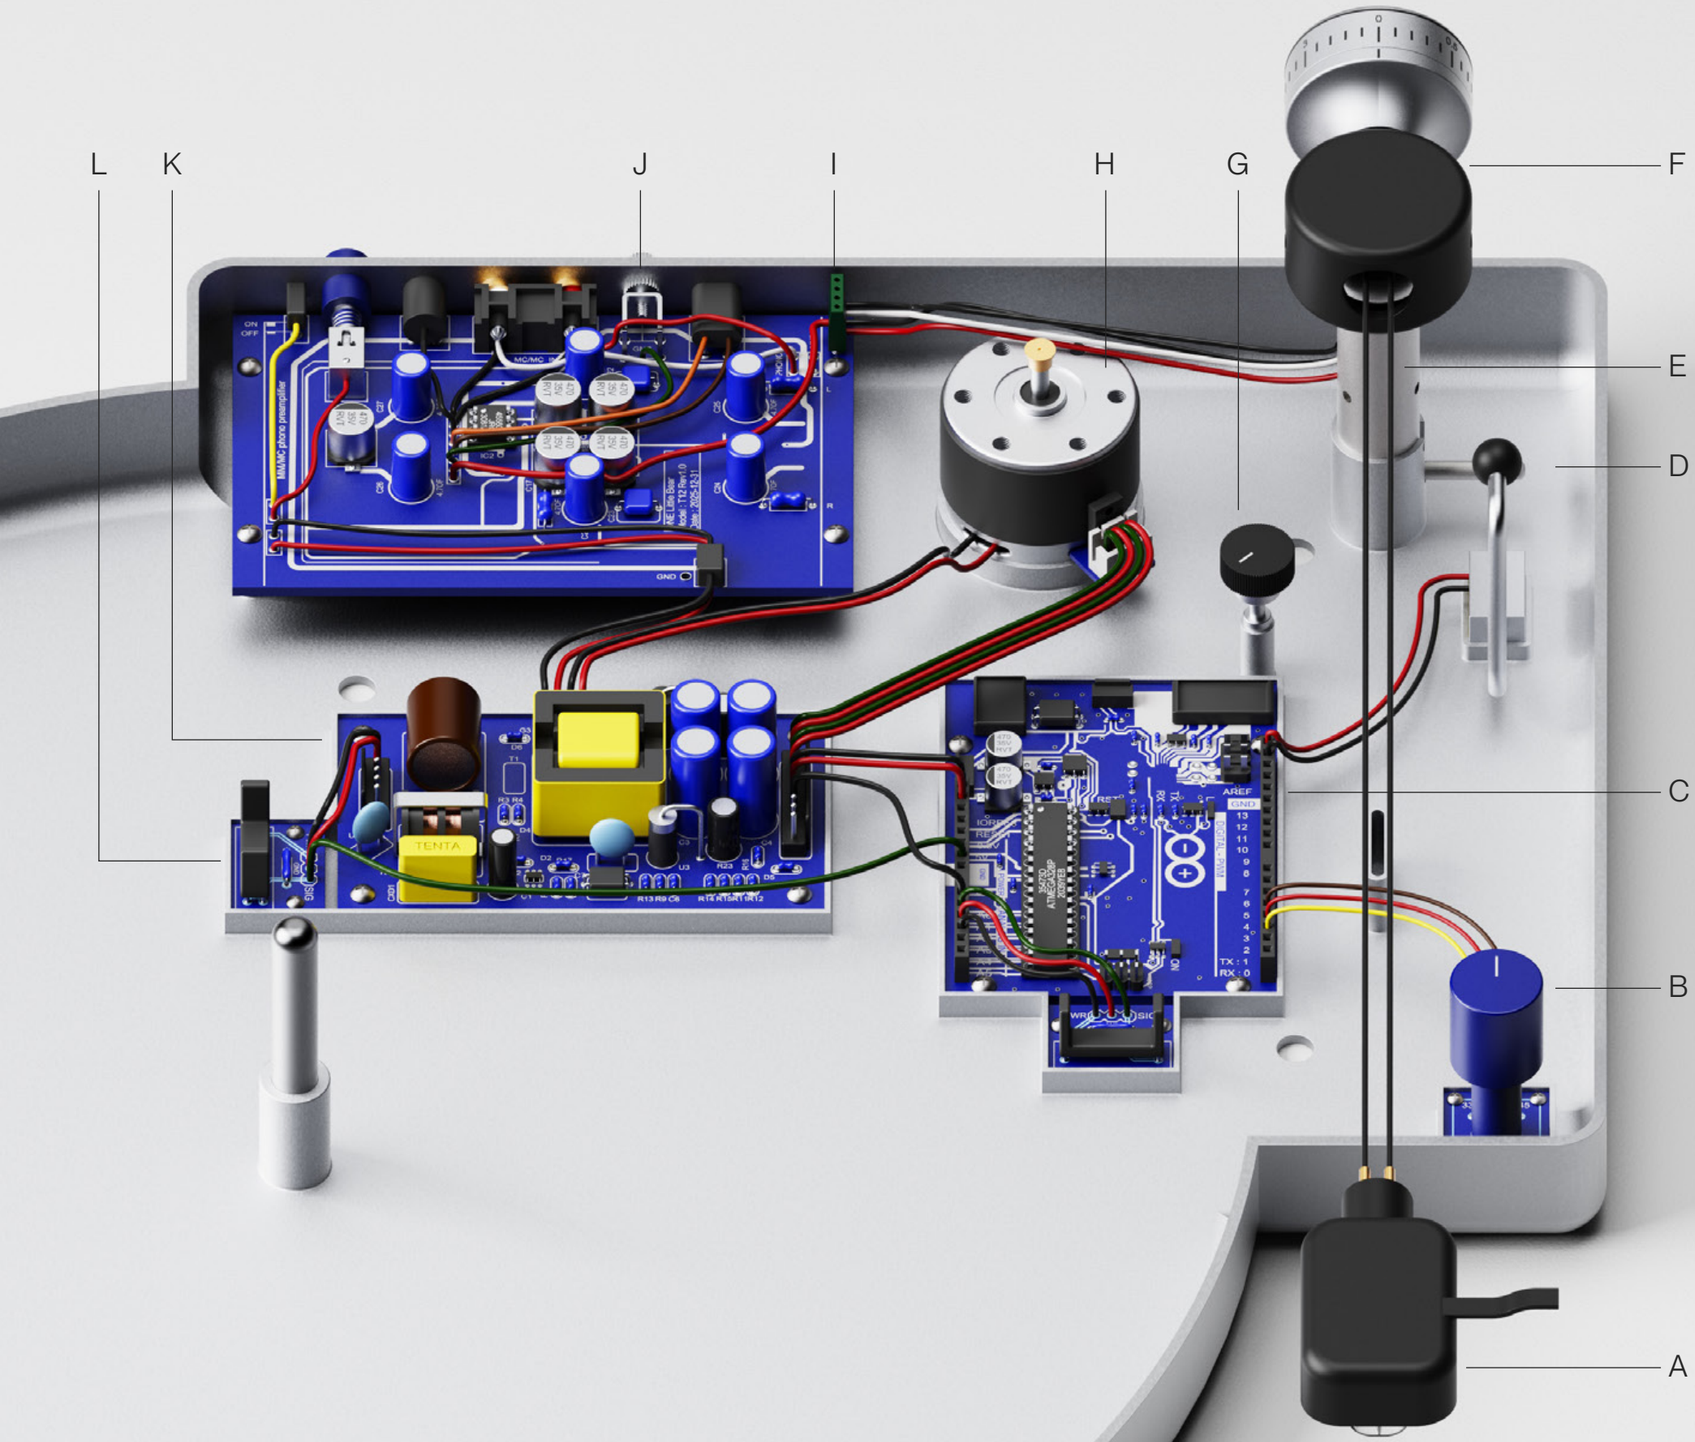
The design of asymetrica is rooted in a formal exploration conducted through numerous sketches, refined element by element. From the chassis to the tonearm and the clarity of the controls, every detail has been designed to create a compact and cohesive whole. The volumes and proportions draw from the study of iconic references, anchoring the object in a mastered formal culture. The turntable remains discreet, capable of integrating naturally into any environment.



TOP VIEW	DIMENSIONS : 340 x 360 x 60 mm

DETAILS AND GESTURES.

The external architecture was designed in alignment with the internal mechanics. The placement of each component follows a direct mechanical logic. Operating the turntable becomes a sequence of simple gestures: releasing the tonearm, pressing ON, placing the vinyl, selecting the speed (33 or 45 RPM), and finally engaging playback with the lever. Every action contributes to making the mechanism both understandable and intentional.

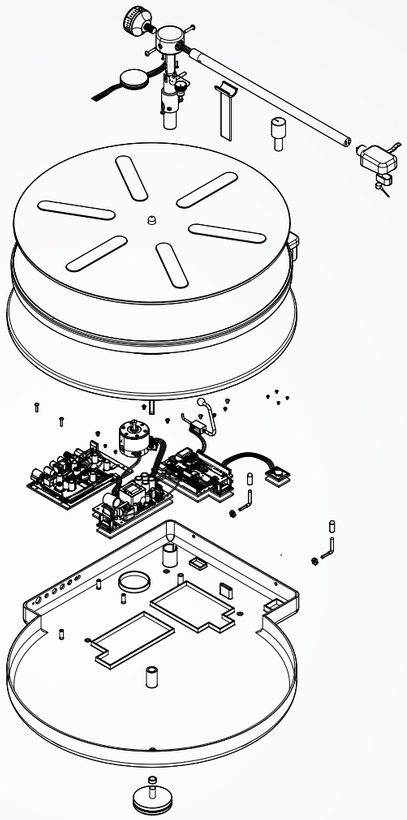


INTERNAL COMPONENTS.

When the 33 or 45 RPM mode is engaged (B), the signal is transmitted to the logic board (C), which controls the power supply board (K) to activate the motor (H) and drive the vinyl's rotation. The stability of the tonearm (E) is maintained by the anti-skating (G) and the counterweight (F), ensuring controlled pressure on the record. The lift solenoid (D) is then activated to precisely lower the arm onto the vinyl.

As the stylus (A) travels through the grooves, it generates a signal transmitted as an electromagnetic wave through the four tonearm cables (E). These are connected to a terminal block (I), then to the preamplifier (J), which handles amplification and sound reproduction. At the end of the record, position sensors (L) automatically trigger the tonearm's return to its initial position.

The internal construction is based on the analysis of teardown videos and technical and electronic references. This process allowed me to streamline the components and design a simplified, readable, and modular interior.



MATERIALS.

I selected the materials for the main components to achieve a precise balance between lightness, tactile handling, and acoustic stability. Since sound is generated by electromagnetic vibration, the object must remain perfectly balanced. The structure combines a composite and die-cast aluminum chassis with a cast brass platter to ensure acoustic neutrality. The assembly is completed with a carbon diamond cartridge, a drawn magnesium tonearm, silicone feet, and a rubber platter mat.

TRAKK

SOLUTIONS FOR CONSTRUCTION WORKERS.

As part of an eco-design project, we created TRAKK, a company dedicated to renting and selling innovative solutions for construction professionals. Our goal: to improve site efficiency while enhancing working conditions. The project was inspired by a podcast on energy-efficient renovation, which helped us understand upcoming ecological challenges and identify systemic failures within the sector. Project led in collaboration with Marine Contin and Noé Despres.

 # 30 : Low-carbon living.

STARTING POINT.

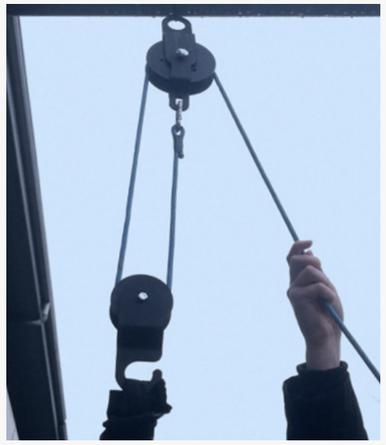
The project was born from an episode of the Time To Shift podcast, focusing on the report 'Living in a Low-Carbon Society' and the residential building sector. After analysis, we chose to focus on energy renovation: a major lever for transition that is still hindered by a lack of awareness and the complexity of construction sites. The challenge is to improve building performance to reduce energy consumption, limit CO_2 emissions, and enhance thermal comfort.

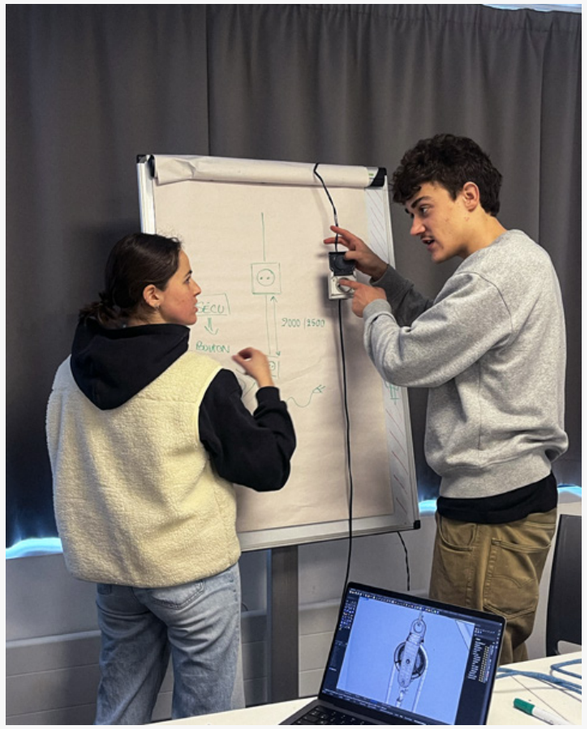
CHALLENGES.

Energy renovation has become a major headache, caught between administrative complexity, skyrocketing costs, and a lack of clarity for homeowners. This deadlock is worsened by technically demanding construction sites and a shortage of skilled professionals in the field. We have therefore chosen to focus on the workforce, as the human factor is what currently dictates the transition from intention to concrete realization.

FIELD RESEARCH.

To ground our theoretical analysis in reality, we visited construction sites across Paris to meet the workers. Our observations revealed a grueling physical reality: uncomfortable postures, a lack of specialized equipment, and constant pressure. This daily grind exhausts tradespeople and ultimately impacts the success of the projects themselves.



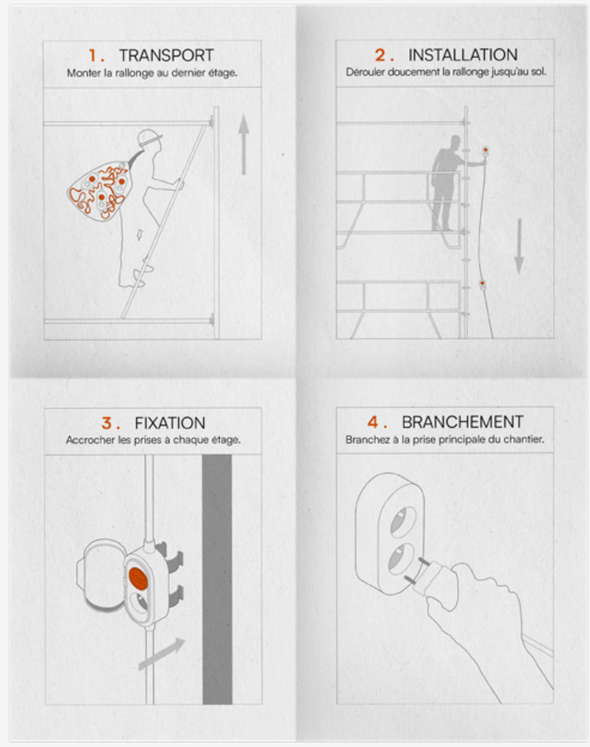


PROTOTYPING.

We moved forward guided by our key problem statement: ‘How can we rethink the working conditions of workers on energy renovation sites to combine efficiency and flow?’ From this, we designed and prototyped a range of three objects: an insulating tarp, a lifting pulley, and an adaptable power strip. This design stage was crucial, as it forced us to confront the technical realities of the trade while adhering to safety standards and the specific material constraints of the construction site.

THE ADAPTABLE POWER STRIP.

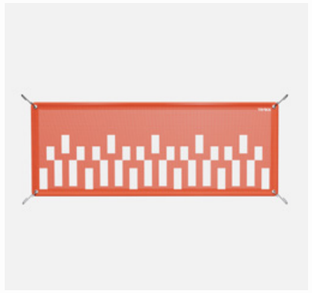
Our first solution is a scaffolding power strip designed to supply electricity to every level of the construction site. It offers a valuable time-saving benefit by eliminating unnecessary back-and-forth trips, allowing workers to stay focused on their tasks. We prioritized safety with a 12 mm diameter cable and a simple locking system, ensuring reliable use.



Focus on the fastening system

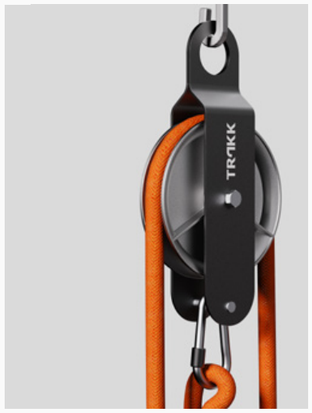
Winter tarp

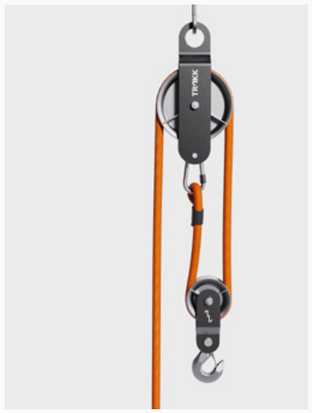
Summer tarp



THE INSULATING TARP.

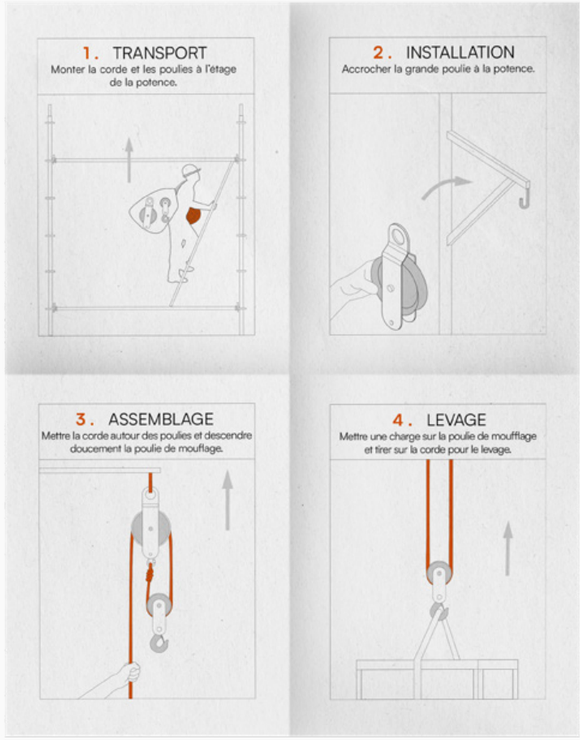
This tarp provides adaptable protection against both inclement weather and heatwaves. It operates with two removable modules: a black side to insulate against rain and wind in winter, and an orange side to shield from summer radiation. Beyond worker comfort, the project focuses on repurposing materials, using defective Zodiac boat fabric for the summer version and micro-perforated advertising banners for the winter.





THE BLOCK AND TACKLE PULLEY.

This lifting device facilitates the transport of materials at height using a jib, a pulley system, and a rope. By cutting the required effort in half, it reduces worker fatigue while improving the overall workflow on-site. Since electric systems are often considered too costly, it was essential for us to offer a simple mechanical solution accessible to everyone.



HOW IT WORKS.

To better understand how TRAKK operates from production to the life cycle of our objects, we have illustrated the entire process through a simplified ecosystem map.

IMPACTS AND PROJECTIONS.

The TRAKK project goes beyond the simple creation of objects to offer a comprehensive vision of the construction site. By improving comfort and safety, we aim to restore the appeal of building trades and foster the creation of sustainable jobs. Our ambition is now to expand our range to include insulation and diagnostic solutions, while integrating a training program to support professionals in using our equipment.

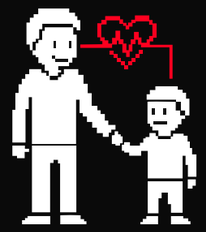
SYNC

DESIGNED FOR GAMERS AND JAM LOVERS.

A GAMING CONSOLE FOR MUSIC.

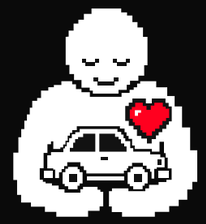
What if nostalgia could be used as a creative tool in design? Today, digital consumption of music and video games can isolate us and fragment our attention. In response, I designed Sync, an instrumental console that turns music-making into a collective game for teenagers. By placing physical gestures at the heart of the experience, Sync encourages active listening, concentration, and creativity.

If you'd like to view my thesis.



1. UNITE

2. MATERIALITY



3. EMOTIONS

MASTER'S THESIS - KEY POINTS.

As part of my Master's degree, I explored how iconic objects from the past continue to influence contemporary design. My research highlighted how nostalgia, materiality and emotional attachment can connect generations and give objects lasting value. Nostalgia became the starting point for my graduation project, turning my research into a tangible design opportunity.

Walkman - WM-F2015, Sony, 1989.

40 %

Percentage of the population playing video games.

https://newzoo.com/resources/trend-reports/newzoo-global-games-market-report-2025

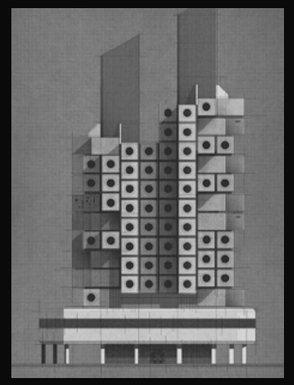
82 %

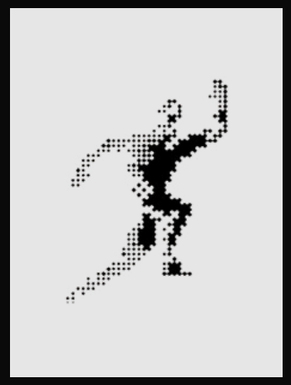
Percentage of French people listening to music daily.

https://www.mediametrie.fr/fr/lannee-audio-2024-2025

NOSTALGIA - THEMES.

Nostalgia is often linked to fleeting trends and marketing that encourage overconsumption. This led me to the following question: How can I create a desirable object through nostalgic emotional connections, without reproducing the cycle of obsolescence nostalgia can create? I chose video games and music, two fields that resonate with a wide audience and empower people to create and express themselves.





CHALLENGES - USERS - INSPIRATIONS.

The project targets 13–18-year-olds in multiplayer gaming contexts at home. It explores the effects of screen culture on attention, social interaction, instant gratification, and physical interaction, with potential impacts on cognitive responses and reflexes. The visual direction draws from classic Nintendo, arcade and pixel culture, with Bauhaus-inspired geometry and color palettes.

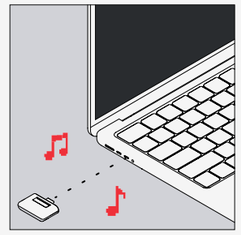
1. ATTENTION

2. LOSS OF PHYSICAL INTERACTION

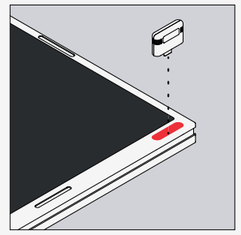
3. SOCIAL ISOLATION

NES, Nintendo, 1985

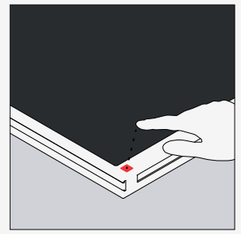
SYNC - THE MUSICAL GAMING CONSOLE



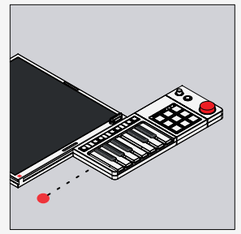
1. LOAD



2. INSERT



3. POWER ON

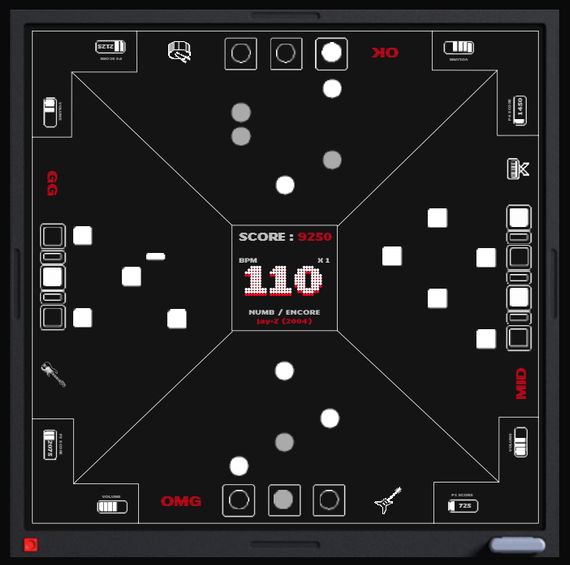


4. CONNECT

CONCEPT.

Sync is a gaming console that lets teenagers experience their favorite music while learning to create and manipulate sounds. It features instrument controllers for multiplayer play, which slide directly into the console's screen and allow each player to interact with the game. A game cartridge stores games, music, and sound creations, allowing users to save and share content. To play, users load their chosen content onto the cartridge, insert it into the console, connect the controllers, and start playing.

JAM MODE - GAMEPLAY

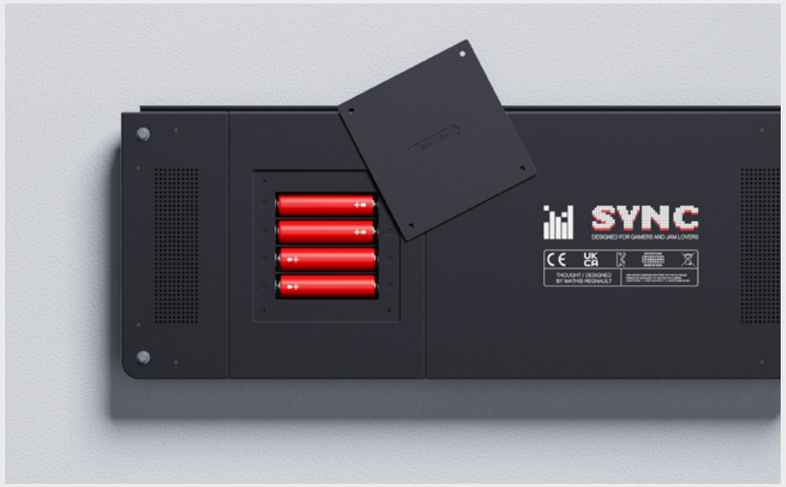


STUDIO MODE - A TRACK FROM A TO Z

STUDIO MODE - LIKE A D.J

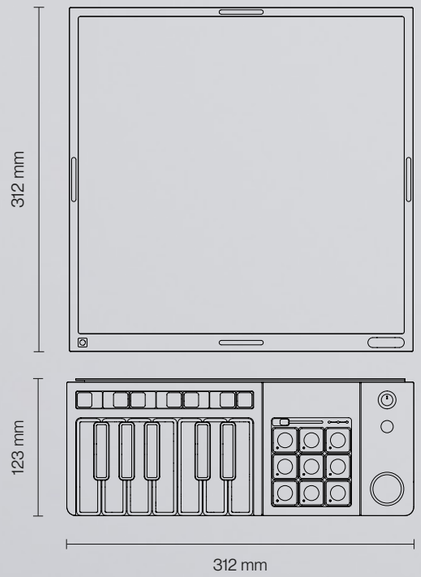
CLICK HERE TO SEE THE GAMEPLAY ANIMATED.

The experience is divided into two modes. Jam lets players engage with their favorite tracks by playing each instrument. The goal is to follow the rhythm accurately, earn the highest score, and unlock more challenging levels. Once the basics are mastered, Studio takes over. Players can mix like a DJ or create tracks from scratch using an intuitive interface and skills developed through gameplay.



DETAILS AND GESTURES.

The controller is designed for quick and intuitive handling. It runs on batteries and slides into the console using a rail system. Audio inputs allow users to connect headphones, instruments, or a microphone for a richer experience.



MATERIALS.

The console combines recycled aluminum CNC-machined components with recycled ABS injection-molded parts. The screen features a three-color E Ink display with a tempered glass cover. The controls use double-shot PBT for durability, while the joystick is fitted with rubber feet for grip.

THE SYNCERS.

Sync would partner with Spotify to bring music directly into the game. By connecting the cartridge to a computer or smartphone, users can access their favorite tracks and turn them into gaming sessions. The interface also highlights popular tracks, user creations, and community scores, encouraging players to discover, create, and share. This approach rethinks how we experience music and video games, using creativity and social interaction to create a shared experience.

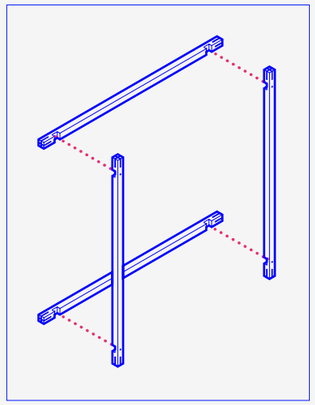
*The hands were added using AI.

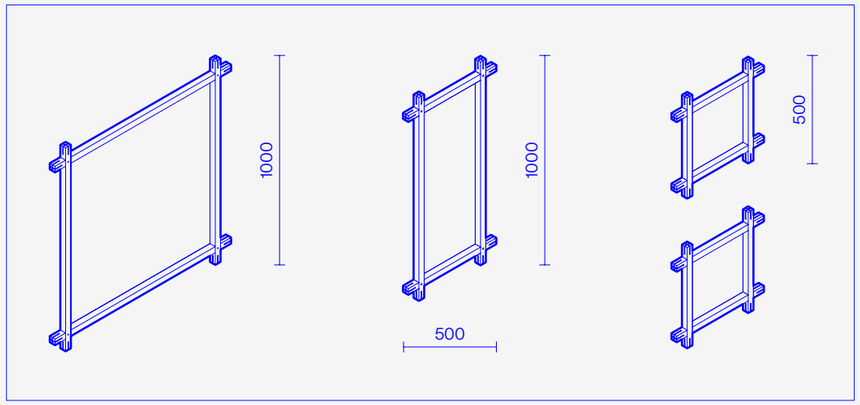
STAND-UP

45%

THE ADAPTABLE **POP-UP STAND.**

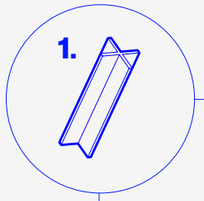
Born from a desire to bridge the gap between virtual design and material reality, this extracurricular project moves away from 3D rendering to become a tangible artifact. Developed with Théophile Rousseau, Stand-up is a structural system adaptable to any type of event, from festivals to sporting aid stations or pop-up shops. The challenge was to design a lightweight, sturdy, and cost-effective installation, engineered for rapid deployment and total modularity according to user needs.

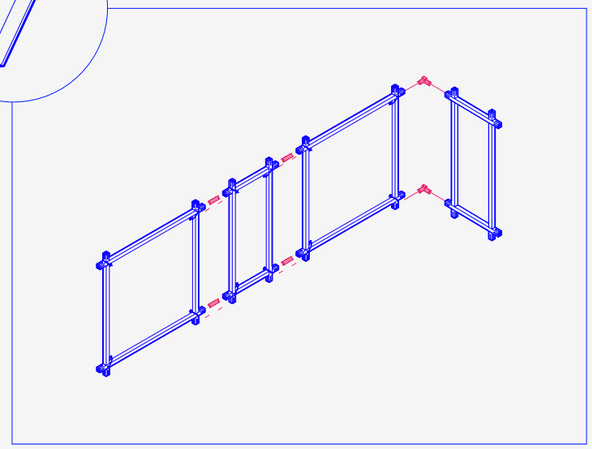


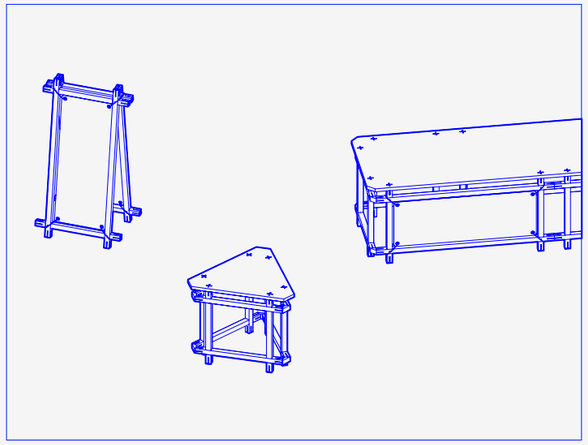


BLOCK SYSTEM.

The principle is based on the assembly of four grooved wooden cleats forming a block. Much like a construction set, these blocks are designed to interlock with one another, offering infinite modularity through three formats: 1000 x 1000, 1000 x 500, and 500 x 500 mm. The system is assembled without screws or glue, using 3D-printed fasteners (see diagram 1) that guarantee the structure's sturdiness while facilitating assembly.



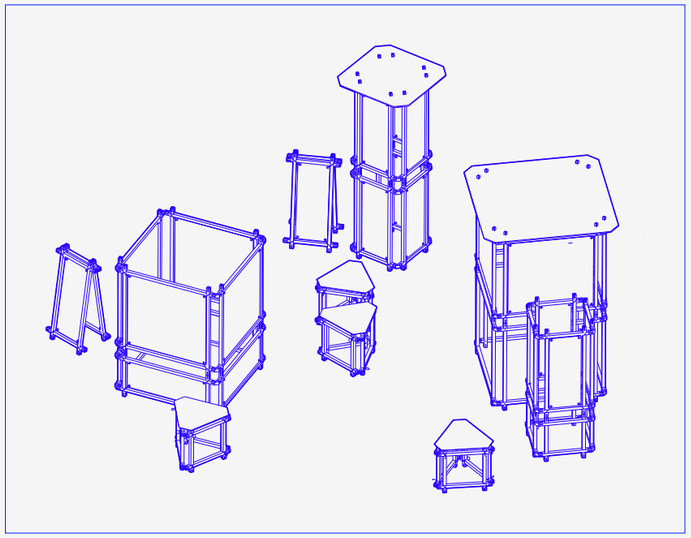




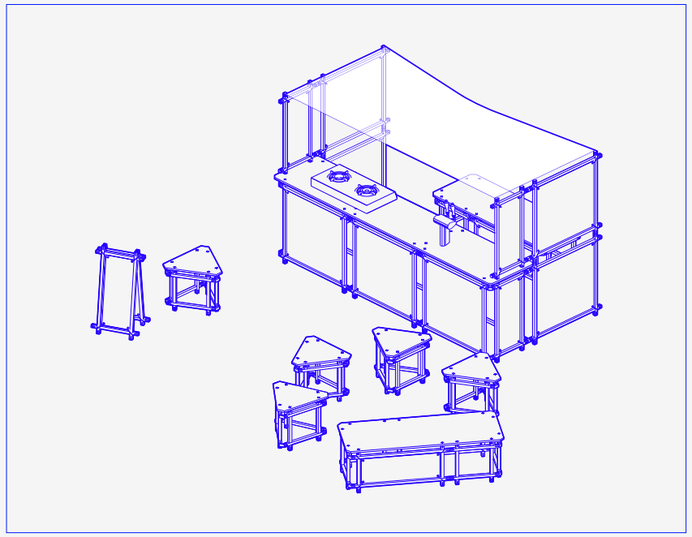
ENDLESS POSSIBILITIES.

The combination of blocks and fasteners multiplies the potential configurations. Initially designed for stand architecture, these modules can also be adapted to create furniture such as benches, partitions, or stools. This approach rationalizes production by using a single manufacturing process to meet a wide variety of needs.

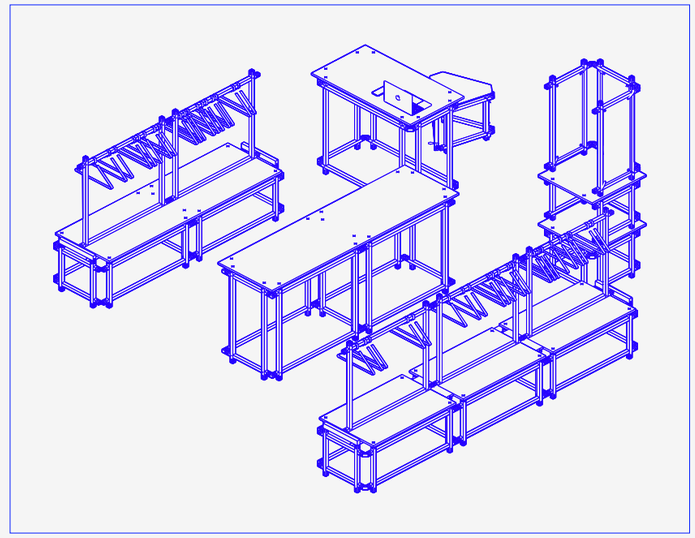
Exhibition Scenography



Food and Beverage Station

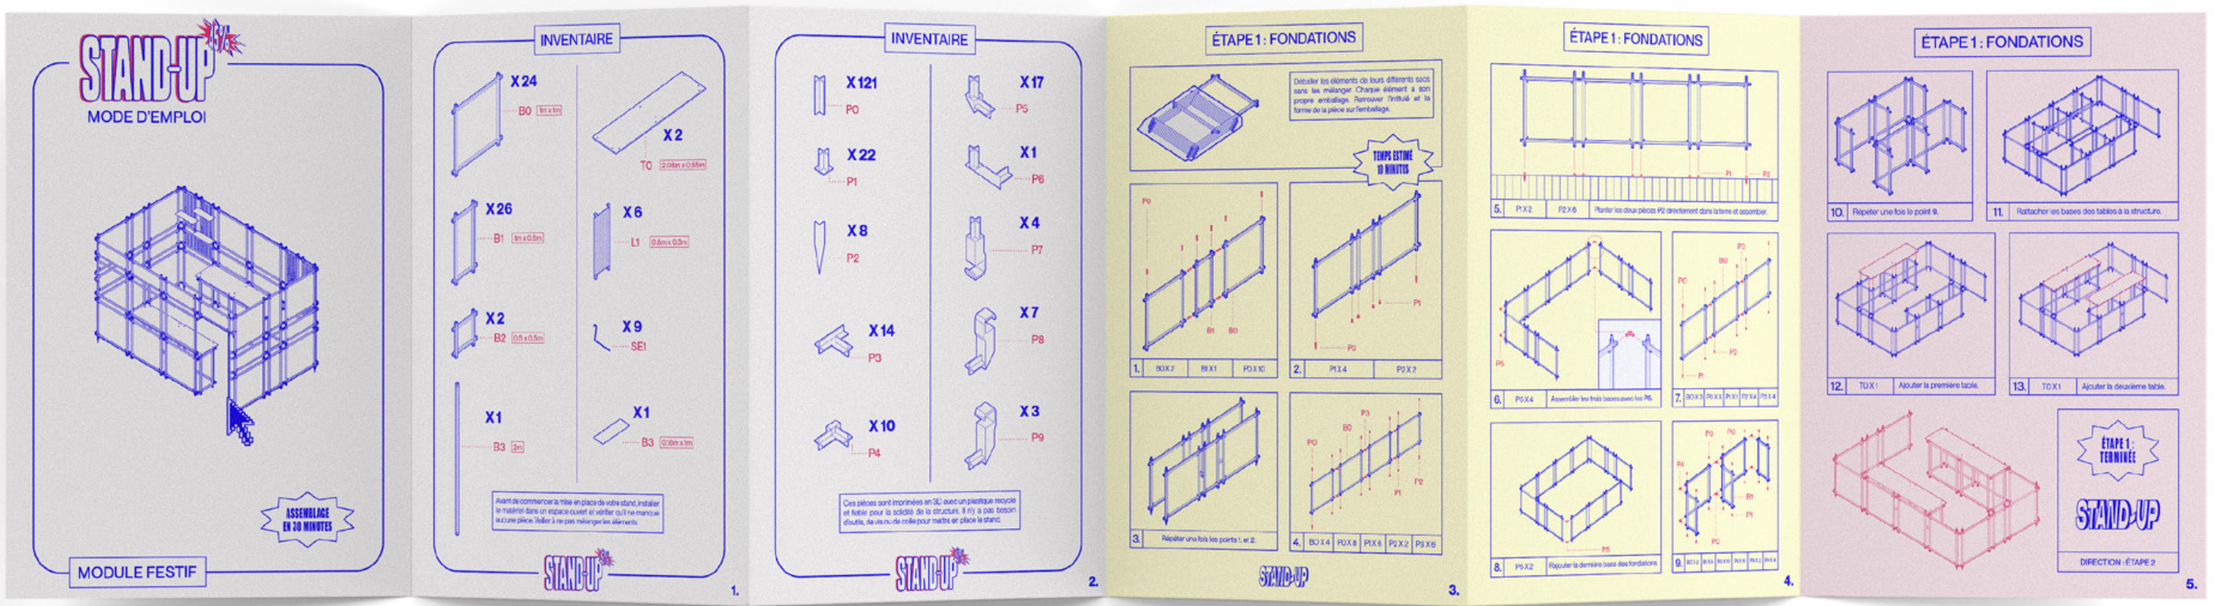


Pop-up Thrift Store



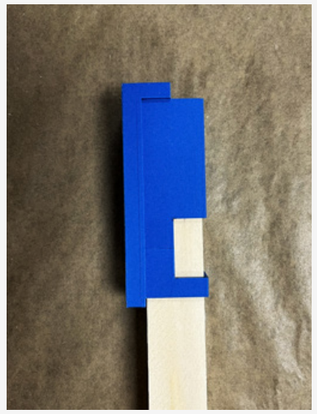
SOME EXAMPLES.

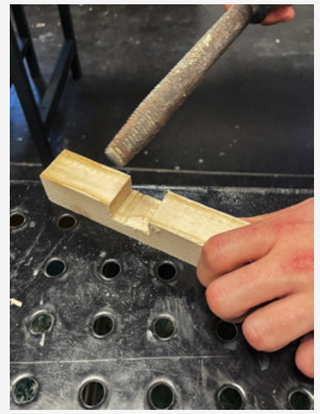
Stand-up adapts to every use thanks to its modularity from sporting aid stations to coworking spaces and music stages. The flexibility of its modules allows it to respond precisely to the specific constraints of any situation.

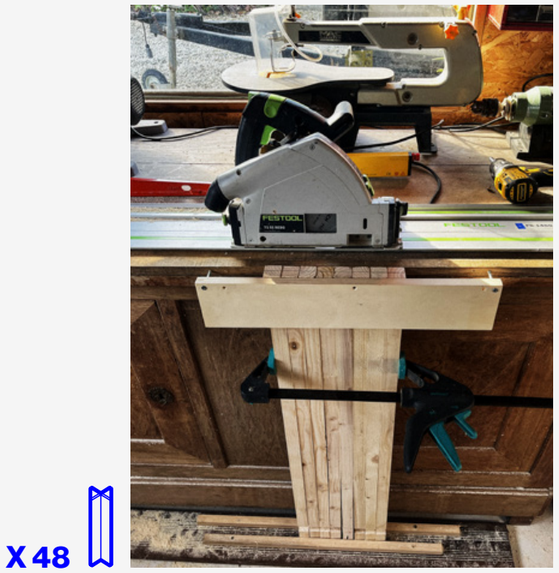


USER GUIDE.

Users choose their module type then receive the materials and user guide to build the stand themselves. They check the inventory, remove the blocks from the packaging, and follow the instructions step by step. Finally, the entire system is designed to be easily packed away and sent back to the warehouse once use is complete.

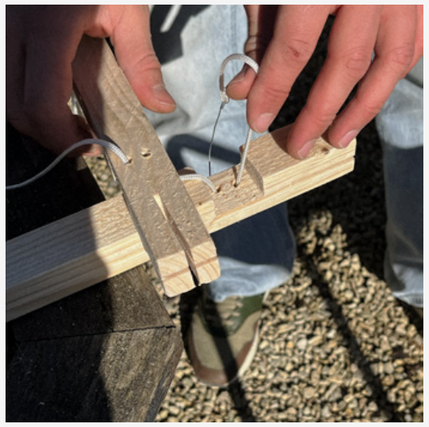






PROTOTYPING AND CUTTING.

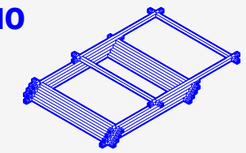
To test our idea in the real world, we prototyped a sample consisting of about ten blocks and two stools. We began by cutting 2-meter fir cleats to the dimensions of our blocks using a panel saw. Then, using a cutting template, we marked and shaped the pieces with a band saw and a file. Finally, we designed a custom workbench to machine the slots in the cleats using a plunge saw.



ASSEMBLY.

After two days of work, we sanded and then assembled our cleats by drilling holes for cables, which were made adjustable using cable clamps. This tightening system was designed for quick setup and to reduce storage and transport volume.

X 10



SETUP.

Once the model was done, we tested the structure under real-world conditions in the landscapes of the Aube region. The sample stand can be set up in a few minutes, revealing a play of light and wind that emphasizes its lightness. The fabric, which is fully customizable with logos, screen printing, or patterns, allows users to make the object their own.

Installation in Montgueux, Aube (France) in the late afternoon.

THANK YOU !
